

Cooling tunnel - modular

Modular cooling tunnels are made entirely of removable panels with standard dimensions, and are mainly dedicated to use in automatic powder coating plants with power&free or monorail conveyors.

Thanks to the rolling technology developed by ROMER, they can reach dimensions of up to several meters in width or height, while maintaining rigidity, the length of such structures is practically unlimited.

The energy recovered from the cooling tunnels is used in other processes as needed, such as paint polymerization or surface pretreatment.
